2. Hog Exports, Canada, 2000 to 2009	8

## Highlights

---

- Canadian hog producers had an estimated 12.1 million hogs on their farms, down 6.7% from July 1, 2008.
- The Canadian breeding herd, mainly sows and gilts, declined 4.6% to almost 1.4 million head during the last year.
- During the first two quarters of 2009, hog producers nationally exported an estimated 3.3 million hogs, down 34.6% from same period last year.
- Recently, new Country of Origin Labeling (COOL) regulations in the United States have constrained market access. The perception of the H1N1 virus has also had a negative impact on markets.

# Analysis

## Livestock Statistics, as of July 1<sup>st</sup> 2009

As of July 1, 2009, the number of hogs and cattle on Canadian farms was down from the same date a year earlier, while the number of sheep remained virtually unchanged.

**Text table 1**  
**Livestock inventories at July 1**

	Cattle		Hogs		Sheep

**Note(s):** Figures may not add up to totals because of rounding.

## Hog inventories still decreasing

Canadian hog producers had an estimated 12.1 million hogs on their farms, down 6.7% from July 1, 2008. Hog inventories have been decreasing since 2006, following a period of investments in more efficient barns in the late 1990s and early years of 2000.

**Chart 1**  
**Hog inventory on farm per quarter, Canada, 2000 to 2009**

millions of head

The Canadian breeding herd, mainly sows and gilts, declined 4.6% to almost 1.4 million head during the last year. As sows decrease so do the number of farrowings. Farrowing intentions for the third quarter of 2009 are down 4.1% from the same period last year and are expected to be down 5.5% for the fourth quarter. At June 1 the US breeding herd has decreased 3.0% from the same date last year.

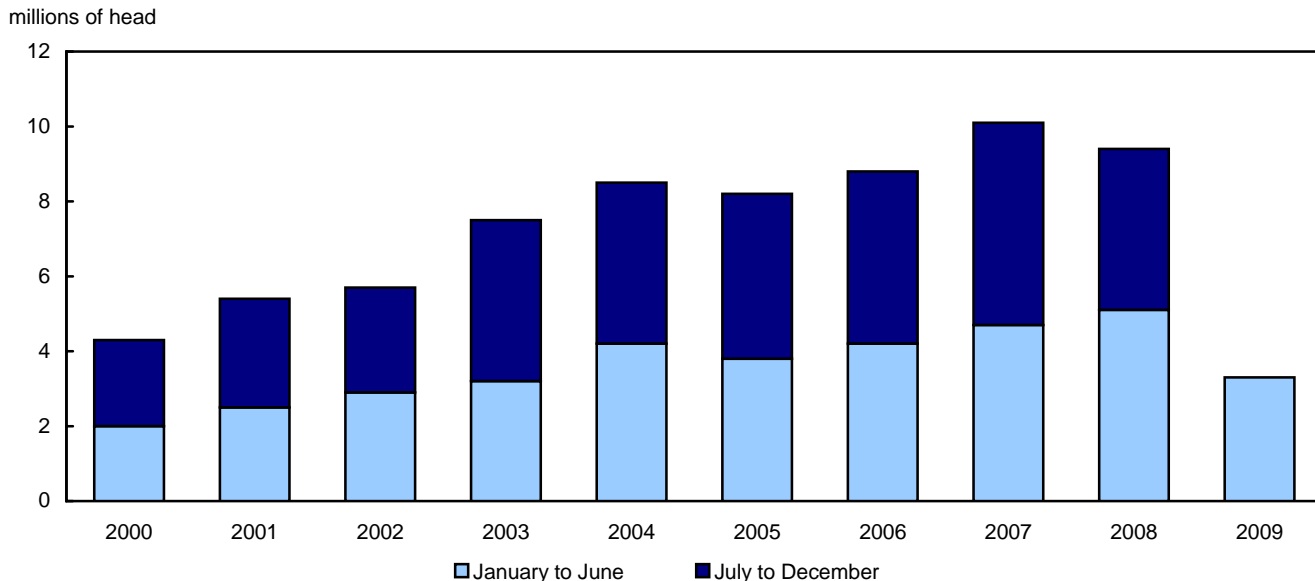

Prior to the onset of this decline, hog producers had tolerated tough times in the industry while waiting for markets to improve. By 2006, some hog producers began leaving the industry, reflecting a number of factors. These include high feed costs, low commodity prices, a strong Canadian dollar and the economic downturn. The downturn has reduced access to credit for producers and decreased meat demand by consumers. Last year, the Canadian government put a Cull Breeding Swine Program in place to help hog producers reduce the size of their breeding herds.

Recently, new Country of Origin Labeling (COOL) regulations in the United States have constrained market access. The perception of the H1N1 virus has also had a negative impact on markets.

Despite hog inventories decreasing since 2006, hog slaughter remains strong in 2009 as more weaners were fed to slaughter weight in Canada rather than being exported to US finishing operations. Domestic slaughter capacity increased, mainly in the Prairies.

During the first two quarters of 2009, hog producers nationally exported an estimated 3.3 million hogs, down 34.6% from same period last year. The bulk of hog exports are market hogs shipped to slaughter and weaner hogs shipped for feeding. In the first and second quarters, hogs exported for slaughter are down 58.5%, and weaner hog exports are down 27.6% from the same period one year ago. Manitoba, the main exporting province, had a 32.4% decrease in exports in the first and second quarters of 2009.

**Chart 2**  
**Hog exports, Canada, 2000 to 2009**

Revenues from the sale of hogs declined 2.9% in 2008, the fourth consecutive annual decrease. The average annual weighted price in Ontario, a leading hog price indicator in Canada, remained virtually unchanged in 2008 from the previous year. This is a decrease of \$29 since its peak of \$86 per hundred weight in 1996. Historically, decreases in hog prices were generally recovered within a year or two, even following the price collapse in the fall of 1998. However current hog prices have not recovered since 2005.

1. Number of pigs born during the quarter that were either on hand at the end of the quarter or had been sold.
2. Export numbers from International Trade Division of Statistics Canada have been adjusted using secondary information to more accurately reflect province of origin. Canadian export totals remain unchanged.
3. Other disposition principally represents slaughter on a province of origin basis and may include hogs destined for export; varies by province.

1. Number of pigs born during the quarter that were either on hand at the end of the quarter or had been sold.

2. Export numbers from International Trade Division of Statistics Canada have been adjusted using secondary information to more accurately reflect province of origin. Canadian export totals remain unchanged.

3. Other disposition principally represents slaughter on a province of origin basis and may include hogs destined for export; varies by province.

# Concepts and methodology

---

## Livestock statistics

### Concepts

Inventory levels of the various types of livestock intended for sale in Canada are measured at specific times throughout the year. Surveyed operations are requested to include all animals located on the farming operation, regardless of ownership. They are also asked to include animals owned but pastured on a community pasture, grazing co-op or public land. Producers are asked to exclude animals owned but kept on a farm, ranch or feedlot operated by someone else. Inventory levels are estimated for cattle, calves, pigs, sheep and lambs. Estimates are also produced for certain categories of animals on the basis of age, sex, weight and/or purpose i.e. breeding or slaughter.

Current information on livestock inventories and related statistics such as supply and disposition enable those active in the agricultural sector to observe and assess changes in the industry, measure performance and keep the agricultural community and general public informed of developments. The primary data users are federal and provincial governments, producer boards, farmers and farm organizations, private business, academic research institutions and students. Livestock data assists governments in formulating agricultural policies and developing programs. Farming organizations use statistics in developing recommendations for producers and governments. Farmers make increasing use of prices, production, and marketing statistics in planning their operations. In addition, these livestock statistics are used in the calculation of farm incomes and in the Canadian System of National Accounts for indicators such as gross domestic product.

### Methods

To produce livestock estimates, there are actually 6 different survey occasions. All of the survey occasions collect data primarily using Computer Assisted Telephone Interviews (CATI) although there are special procedures in place for the very large or complex operations.

Two of the occasions are the January Livestock Survey and the July Livestock Survey. These are large-scale general livestock surveys collecting data on cattle, hogs and sheep, referring to inventories at the 1st of the month. The probability samples include about 10,260 operations at January 1, and about 16,260 operations at July 1. These surveys collect data during a three-week period in the western provinces, Ontario and Quebec. Regardless of when operators respond, they are asked to report inventories as of January 1 or July 1. The livestock survey results are released, following processing and analysis, approximately seven weeks after the reference date.

Hog inventories are the focus of two other survey occasions collecting estimates of pig numbers at April 1 and October 1. This survey was initiated in 1998 as estimates from 1978 to 1997 were based solely on analytical tools. For the hog surveys, a sub-sample of the prior livestock survey is used. The probability samples are approximately 2,100 operations and 2,500 operations, respectively, at April 1 and October 1 and, similar to the livestock surveys, these CATI surveys cover the western provinces, Ontario and Quebec. Producers are requested to report their inventories as of the reference date, although the data are collected during a 7-day period near or before that date. The hog survey results are normally released three to four weeks after the reference date.

The June and November Atlantic Surveys are used to produce estimates for that region. These surveys are multi-purpose collecting data, primarily inventories, on livestock including cattle, hogs and sheep in addition to collecting data related to the area, yield and production of the principal field crops. The probability samples are about 1,000 operations in June and 1,100 operations in November. The results are released at the same time

as the livestock results. For reference points where surveys do not exist for the Atlantic region, analytical tools are used to produce the estimates.

The total inventories are now distributed to a specific farm type, on the basis of survey results and sector level balance sheets. The two major categories are dairy and beef. The beef sector is then broken down to beef cattle on cow/calf and mixed beef and dairy operations; beef cattle on feeder, stocker/finish operations; and, beef cattle on feeding operations, which include feedlots.

Canadian exports to the United States are obtained from U.S. import custom documents and are officially released by the International Trade Division of Statistics Canada. These data try to register the province of origin of the commodity, but when unknown, will reflect the province of entry into the United States. Information from secondary sources is used by Agriculture Division of Statistics Canada to better estimate the province in which the commodity was raised/grown. Administrative data from the provinces are used to adjust the export numbers by province to better reflect provincial production. Though this methodology will result in different exports by province, the Canadian export totals will equal those released by International Trade Division.

To summarize, the livestock statistics are survey-based estimates. The survey relies on a list frame that is established every five years by the Census of Agriculture and updated to include new entrants, particularly large hog operations. The probability sample surveys are conducted by telephone. The survey results are analysed and corrected before the data are used to analyse the industry and fine-tune the estimates. The survey data are reviewed in a board environment before the commodity analyst works with the data primarily using supply-disposition analysis. The results of the industry analysis are reviewed by the board before being sent to the individual provinces. Once the data are finalised they are released to the public and published. The principal data released include inventories and summarized supply-disposition tables. The data also flow, via farm income estimates, to the Canadian System of National Accounts. In addition the data are used in the calculation of net farm income projections, produced by Agriculture and Agri-Food Canada in co-operation with Statistics Canada and the provinces.
